

Alan Turing invented a test which he called 'The Imitation Game' (which we know as 'The Turing Test'). It was a test designed to work out if a machine could really think for itself.

Think about our modern computers and phones and the apps and bots designed to look as though you are talking to a real person.

Do you think that machines can already think for themselves or is this something that could never happen?

Write down your thoughts in order to persuade a reader of your point of view.

Machines Can Think For Themselves	Machines Can't Think For Themselves

I think machines can/can't think for themselves because...
